<b>7 Indices and tables</b>	<b>75</b>
<b>Python Module Index</b>	<b>77</b>
<b>Index</b>	<b>79</b>

Extract and analyze Acoustic Emission measurement data.

The IO module *vallenae.io* enables reading (and writing) of Vallen Systeme SQLite database files:

- **\*.pridb**: Primary database
- **\*.tradb**: Transient data
- **\*.trfdb**: Transient features

The remaining modules are system-independent and try to comprise the most common state-of-the-art algorithms in Acoustic Emission:

- *vallenae.features*: Extraction of Acoustic Emission features
- *vallenae.timepicker*: Timepicking algorithms for arrival time estimations

Read/write Vallen Systeme database and setup files.

## 1.1 Database classes

Classes to read/write prddb, tradb and trfdb database files.

<b>Warning:</b> Writing is still experimental
---

<i>PriDatabase</i> (filename[, mode])	IO Wrapper for prddb database file.
<i>TraDatabase</i> (filename[, mode, compression])	IO Wrapper for tradb database file.
<i>TrfDatabase</i> (filename[, mode])	IO Wrapper for trfdb (transient feature) database file.

### 1.1.1 vallengae.io.PriDatabase

**class** vallengae.io.**PriDatabase**(*filename*, *mode*='ro')  
IO Wrapper for prddb database file.

#### Attributes

<i>connected</i>	Check if connected to SQLite database.
<i>filename</i>	Filename of database.

**vallenae.io.PriDatabase.connected**

**property** PriDatabase.connected: **bool**  
Check if connected to SQLite database.

**Return type** **bool**

**vallenae.io.PriDatabase.filename**

**property** PriDatabase.filename: **str**  
Filename of database.

**Return type** **str**

**Methods**

<code>__init__(filename[, mode])</code>	Open pridb database file.
<code>channel()</code>	Get list of channels.
<code>close()</code>	Close database connection.
<code>columns()</code>	Columns of data table.
<code>connection()</code>	Get SQLite connection object.
<code>create(filename)</code>	Create empty pridb.
<code>fieldinfo()</code>	Read fieldinfo table.
<code>globalinfo()</code>	Read globalinfo table.
<code>iread_hits(*[, channel, time_start, ...])</code>	Stream hits with returned iterable.
<code>iread_markers(*[, time_start, time_stop, ...])</code>	Stream markers with returned iterable.
<code>iread_parametric(*[, time_start, time_stop, ...])</code>	Stream parametric data with returned iterable.
<code>iread_status(*[, channel, time_start, ...])</code>	Stream status data with returned iterable.
<code>listen([existing, wait, query_filter])</code>	Listen to database changes and return new records.
<code>read(**kwargs)</code>	Read all data set types (hits, markers, parametric data, status data) from pridb to Pandas DataFrame.
<code>read_hits(**kwargs)</code>	Read hits to Pandas DataFrame.
<code>read_markers(**kwargs)</code>	Read marker to Pandas DataFrame.
<code>read_parametric(**kwargs)</code>	Read parametric data to Pandas DataFrame.
<code>read_status(**kwargs)</code>	Read status data to Pandas DataFrame.
<code>rows()</code>	Number of rows in data table.
<code>tables()</code>	Get table names.
<code>write_fieldinfo(field, info)</code>	Write to fieldinfo table.
<code>write_hit(hit)</code>	Write hit to pridb.
<code>write_marker(marker)</code>	Write marker to pridb.
<code>write_parametric(parametric)</code>	Write parametric data to pridb.
<code>write_status(status)</code>	Write status data to pridb.

**vallenae.io.PriDatabase.\_\_init\_\_**

`PriDatabase.__init__(filename, mode='ro')`  
 Open pridb database file.

**Parameters**

- **filename** (`str`) – Path to pridb database file
- **mode** (`str`) – Define database access: “ro” (read-only), “rw” (read-write), “rwc” (read-write and create empty database if it does not exist)

**vallenae.io.PriDatabase.channel**

`PriDatabase.channel()`  
 Get list of channels.

**Return type** `Set[int]`

**vallenae.io.PriDatabase.close**

`PriDatabase.close()`  
 Close database connection.

**vallenae.io.PriDatabase.columns**

`PriDatabase.columns()`  
 Columns of data table.

**Return type** `Tuple[str, ...]`

**vallenae.io.PriDatabase.connection**

`PriDatabase.connection()`  
 Get SQLite connection object.

**Raises** `RuntimeError` – If connection is closed

**Return type** `Connection`

**vallenae.io.PriDatabase.create**

**static** `PriDatabase.create(filename)`  
 Create empty pridb.

**Parameters** **filename** (`str`) – Path to new pridb database file

**vallenae.io.PriDatabase.fieldinfo****PriDatabase.fieldinfo()**

Read fieldinfo table.

The fieldinfo table stores informations about columns of the data table (like units).

**Return type** `Dict[str, Dict[str, Any]]`**Returns** Dict of column names and informations (again a dict)**vallenae.io.PriDatabase.globalinfo****PriDatabase.globalinfo()**

Read globalinfo table.

**Return type** `Dict[str, Any]`**vallenae.io.PriDatabase.iread\_hits****PriDatabase.iread\_hits**(\**, channel=None, time\_start=None, time\_stop=None, set\_id=None, query\_filter=None*)

Stream hits with returned iterable.

**Parameters**

- **channel** (`Union[None, int, Sequence[int]]`) – None if all channels should be read. Otherwise specify the channel number or a list of channel numbers
- **time\_start** (`Optional[float]`) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (`Optional[float]`) – Stop reading at relative time (in seconds). Read until end if *None*
- **set\_id** (`Union[None, int, Sequence[int]]`) – Read by SetID
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “Amp > 5000 AND RiseT < 1000”

**Return type** `SizedIterable[HitRecord]`**Returns** Sized iterable to sequential read hits**vallenae.io.PriDatabase.iread\_markers****PriDatabase.iread\_markers**(\**, time\_start=None, time\_stop=None, set\_id=None, query\_filter=None*)

Stream markers with returned iterable.

**Parameters**

- **time\_start** (`Optional[float]`) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (`Optional[float]`) – Stop reading at relative time (in seconds). Read until end if *None*
- **set\_id** (`Union[None, int, Sequence[int]]`) – Read by SetID

- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “Number > 11 AND Data LIKE ‘%TimeZone%’”

**Return type** `SizedIterable[MarkerRecord]`

**Returns** Sized iterable to sequential read markers

### vallenae.io.PriDatabase.iread\_parametric

`PriDatabase.iread_parametric(*, time_start=None, time_stop=None, set_id=None, query_filter=None)`  
Stream parametric data with returned iterable.

#### Parameters

- **time\_start** (`Optional[float]`) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (`Optional[float]`) – Stop reading at relative time (in seconds). Read until end if *None*
- **set\_id** (`Union[None, int, Sequence[int]]`) – Read by SetID
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “PA0 >= -5000 AND PA0 < 5000”

**Return type** `SizedIterable[ParametricRecord]`

**Returns** Sized iterable to sequential read parametric data

### vallenae.io.PriDatabase.iread\_status

`PriDatabase.iread_status(*, channel=None, time_start=None, time_stop=None, set_id=None, query_filter=None)`  
Stream status data with returned iterable.

#### Parameters

- **channel** (`Union[None, int, Sequence[int]]`) – None if all channels should be read. Otherwise specify the channel number or a list of channel numbers
- **time\_start** (`Optional[float]`) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (`Optional[float]`) – Stop reading at relative time (in seconds). Read until end if *None*
- **set\_id** (`Union[None, int, Sequence[int]]`) – Read by SetID
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “RMS < 300 OR RMS > 500”

**Return type** `SizedIterable[StatusRecord]`

**Returns** Sized iterable to sequential read status data

**vallenae.io.PriDatabase.listen**

`PriDatabase.listen(existing=False, wait=False, query_filter=None)`

Listen to database changes and return new records.

**Parameters**

- **existing** (*bool*) – Return already existing records
- **wait** (*bool*) – Wait for new records even if no acquisition (writer) is active. Otherwise the function returns after all records are read.
- **query\_filter** (*Optional[str]*) – Optional query filter provided as SQL clause, e.g. “Time >= 100 AND Chan == 2”

**Yields** New hit/marker/parametric/status data records

**Return type** `Iterable[Union[HitRecord, MarkerRecord, ParametricRecord, StatusRecord]]`

**vallenae.io.PriDatabase.read**

`PriDatabase.read(**kwargs)`

Read all data set types (hits, markers, parametric data, status data) from pridb to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to `iread_hits`, `iread_markers`, `iread_parametric` and `iread_status`

**Return type** `DataFrame`

**Returns** Pandas DataFrame with all pridb data set types

**vallenae.io.PriDatabase.read\_hits**

`PriDatabase.read_hits(**kwargs)`

Read hits to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to `iread_hits`

**Return type** `DataFrame`

**Returns** Pandas DataFrame with hit data

**vallenae.io.PriDatabase.read\_markers**

`PriDatabase.read_markers(**kwargs)`

Read marker to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to `iread_markers`

**Return type** `DataFrame`

**Returns** Pandas DataFrame with marker data

**vallenae.io.PriDatabase.read\_parametric**

`PriDatabase.read_parametric(**kwargs)`

Read parametric data to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to [iread\\_parametric](#)

**Return type** DataFrame

**Returns** Pandas DataFrame with parametric data

**vallenae.io.PriDatabase.read\_status**

`PriDatabase.read_status(**kwargs)`

Read status data to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to [iread\\_status](#)

**Return type** DataFrame

**Returns** Pandas DataFrame with status data

**vallenae.io.PriDatabase.rows**

`PriDatabase.rows()`

Number of rows in data table.

**Return type** `int`

**vallenae.io.PriDatabase.tables**

`PriDatabase.tables()`

Get table names.

**Return type** `Set[str]`

**vallenae.io.PriDatabase.write\_fieldinfo**

`PriDatabase.write_fieldinfo(field, info)`

Write to fieldinfo table.

**Parameters**

- **field** (`str`) – Column name of data table
- **info** (`Dict[str, Any]`) – Dict of properties and values, e.g. {"Unit": "[Hz]"}

**Raises** `ValueError` – If field is not a column of data table

### vallena.io.PriDatabase.write\_hit

PriDatabase.**write\_hit**(*hit*)

Write hit to pridb.

Caution: *HitRecord.set\_id* is ignored and automatically incremented.

**Parameters** **hit** (*HitRecord*) – Hit data set

**Returns** Index (SetID) of inserted row

---

**Todo:** Status flag

---

### vallena.io.PriDatabase.write\_marker

PriDatabase.**write\_marker**(*marker*)

Write marker to pridb.

Caution: *MarkerRecord.set\_id* is ignored and automatically incremented.

**Parameters** **marker** (*MarkerRecord*) – Marker data set

**Returns** Index (SetID) of inserted row

### vallena.io.PriDatabase.write\_parametric

PriDatabase.**write\_parametric**(*parametric*)

Write parametric data to pridb.

Caution: *ParametricRecord.set\_id* is ignored and automatically incremented.

**Parameters** **parametric** (*ParametricRecord*) – Parametric data set

**Returns** Index (SetID) of inserted row

---

**Todo:** Status flag

---

### vallena.io.PriDatabase.write\_status

PriDatabase.**write\_status**(*status*)

Write status data to pridb.

Caution: *StatusRecord.set\_id* is ignored and automatically incremented.

**Parameters** **status** (*StatusRecord*) – Status data set

**Returns** Index (SetID) of inserted row

---

**Todo:** Status flag

---

### 1.1.2 vallenae.io.TraDatabase

**class** vallenae.io.TraDatabase(*filename*, *mode*='ro', \*, *compression*=False)  
 IO Wrapper for tradb database file.

#### Attributes

<i>connected</i>	Check if connected to SQLite database.
<i>filename</i>	Filename of database.

#### vallenae.io.TraDatabase.connected

**property** TraDatabase.connected: **bool**  
 Check if connected to SQLite database.

**Return type** **bool**

#### vallenae.io.TraDatabase.filename

**property** TraDatabase.filename: **str**  
 Filename of database.

**Return type** **str**

#### Methods

<i>__init__</i> ( <i>filename</i> [, <i>mode</i> , <i>compression</i> ])	Open tradb database file.
<i>channel</i> ()	Get list of channels.
<i>close</i> ()	Close database connection.
<i>columns</i> ()	Columns of data table.
<i>connection</i> ()	Get SQLite connection object.
<i>create</i> ( <i>filename</i> )	Create empty tradb.
<i>fieldinfo</i> ()	Read fieldinfo table.
<i>globalinfo</i> ()	Read globalinfo table.
<i>iread</i> (*[ <i>channel</i> , <i>time_start</i> , <i>time_stop</i> , ...])	Stream transient data with returned Iterable.
<i>listen</i> ([ <i>existing</i> , <i>wait</i> , <i>query_filter</i> ])	Listen to database changes and return new records.
<i>read</i> (**kwargs)	Read transient data to Pandas DataFrame.
<i>read_continuous_wave</i> ( <i>channel</i> [, <i>time_start</i> , ...])	Read transient signal of specified channel to a single, continuous array.
<i>read_wave</i> ( <i>tra</i> [, <i>time_axis</i> ])	Read transient signal for a given TRAI (transient recorder index).
<i>rows</i> ()	Number of rows in data table.
<i>tables</i> ()	Get table names.
<i>write</i> ( <i>tra</i> )	Write transient data to pridb.
<i>write_fieldinfo</i> ( <i>field</i> , <i>info</i> )	Write to fieldinfo table.

### vallena.io.TraDatabase.\_\_init\_\_

TraDatabase.\_\_init\_\_(filename, mode='ro', \*, compression=False)  
Open tradb database file.

#### Parameters

- **filename** (`str`) – Path to tradb database file
- **mode** (`str`) – Define database access: “ro” (read-only), “rw” (read-write), “rwc” (read-write and create empty database if it does not exist)
- **compression** (`bool`) – Enable/disable FLAC compression data BLOBs for writing

### vallena.io.TraDatabase.channel

TraDatabase.channel()  
Get list of channels.

**Return type** `Set[int]`

### vallena.io.TraDatabase.close

TraDatabase.close()  
Close database connection.

### vallena.io.TraDatabase.columns

TraDatabase.columns()  
Columns of data table.

**Return type** `Tuple[str, ...]`

### vallena.io.TraDatabase.connection

TraDatabase.connection()  
Get SQLite connection object.

**Raises** `RuntimeError` – If connection is closed

**Return type** `Connection`

### vallena.io.TraDatabase.create

**static** TraDatabase.create(filename)  
Create empty tradb.

**Parameters** **filename** (`str`) – Path to new tradb database file

**vallenae.io.TraDatabase.fieldinfo****TraDatabase.fieldinfo()**

Read fieldinfo table.

The fieldinfo table stores informations about columns of the data table (like units).

**Return type** `Dict[str, Dict[str, Any]]`**Returns** Dict of column names and informations (again a dict)**vallenae.io.TraDatabase.globalinfo****TraDatabase.globalinfo()**

Read globalinfo table.

**Return type** `Dict[str, Any]`**vallenae.io.TraDatabase.iread****TraDatabase.iread**(\*, *channel=None*, *time\_start=None*, *time\_stop=None*, *trai=None*, *query\_filter=None*)

Stream transient data with returned Iterable.

**Parameters**

- **channel** (`Union[None, int, Sequence[int]]`) – None if all channels should be read. Otherwise specify the channel number or a list of channel numbers
- **time\_start** (`Optional[float]`) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (`Optional[float]`) – Stop reading at relative time (in seconds). Read until end if *None*
- **trai** (`Union[None, int, Sequence[int]]`) – Read data by TRAI (transient recorder index)
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “Pretrigger == 500 AND Samples >= 1024”

**Return type** `SizedIterable[TraRecord]`**Returns** Sized iterable to sequential read transient data**vallenae.io.TraDatabase.listen****TraDatabase.listen**(*existing=False*, *wait=False*, *query\_filter=None*)

Listen to database changes and return new records.

**Parameters**

- **existing** (`bool`) – Return already existing records
- **wait** (`bool`) – Wait for new records even if no acquisition (writer) is active. Otherwise the function returns after all records are read.
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “TRAI >= 100 AND Samples >= 1024”

**Yields** New transient data records**Return type** `Iterable[TraRecord]`

**vallenae.io.TraDatabase.read****TraDatabase.read**(\*\*kwargs)

Read transient data to Pandas DataFrame.

**Parameters** \*\*kwargs – Arguments passed to [iread](#)**Return type** DataFrame**Returns** Pandas DataFrame with transient data**vallenae.io.TraDatabase.read\_continuous\_wave****TraDatabase.read\_continuous\_wave**(channel, time\_start=None, time\_stop=None, \*, time\_axis=True, show\_progress=True)

Read transient signal of specified channel to a single, continuous array.

The signal is exactly cropped to the given time range. Time gaps are filled with 0's.

**Parameters**

- **channel** (int) – Channel number to read
- **time\_start** (Optional[float]) – Start reading at relative time (in seconds). Start at beginning if *None*
- **time\_stop** (Optional[float]) – Stop reading at relative time (in seconds). Read until end if *None*
- **time\_axis** (bool) – Create the correspondig time axis. Default: *True*
- **show\_progress** (bool) – Show progress bar. Default: *True*

**Return type** Union[Tuple[ndarray, ndarray], Tuple[ndarray, int]]**Returns**If *time\_axis* is *True*

- Array with transient signal
- Time axis

If *time\_axis* is *False*

- Array with transient signal
- Samplerate

**vallenae.io.TraDatabase.read\_wave****TraDatabase.read\_wave**(trai, time\_axis=True)

Read transient signal for a given TRAI (transient recorder index).

This method is useful in combination with [PriDatabase.read\\_hits](#), that will store the TRAI in a DataFrame.**Parameters**

- **trai** (int) – Transient recorder index (unique key between pridb and tradb)
- **time\_axis** (bool) – Create the correspondig time axis. Default: *True*

**Return type** Union[Tuple[ndarray, ndarray], Tuple[ndarray, int]]

**Returns**

If `time_axis` is *True*

- Array with transient signal
- Time axis

If `time_axis` is *False*

- Array with transient signal
- Samplerate

**vallenae.io.TraDatabase.rows**

`TraDatabase.rows()`

Number of rows in data table.

**Return type** `int`

**vallenae.io.TraDatabase.tables**

`TraDatabase.tables()`

Get table names.

**Return type** `Set[str]`

**vallenae.io.TraDatabase.write**

`TraDatabase.write(tra)`

Write transient data to pridb.

**Parameters** `tra` (*TraRecord*) – Transient data set

**Return type** `int`

**Returns** Index (SetID) of inserted row

---

**Todo:** Status flag

---

**vallenae.io.TraDatabase.write\_fieldinfo**

`TraDatabase.write_fieldinfo(field, info)`

Write to fieldinfo table.

**Parameters**

- **field** (`str`) – Column name of data table
- **info** (`Dict[str, Any]`) – Dict of properties and values, e.g. {"Unit": "[Hz]"}

**Raises** `ValueError` – If field is not a column of data table

### 1.1.3 vallenae.io.TrfDatabase

**class** `vallenae.io.TrfDatabase(filename, mode='ro')`  
IO Wrapper for trfdb (transient feature) database file.

#### Attributes

<code>connected</code>	Check if connected to SQLite database.
<code>filename</code>	Filename of database.

#### `vallenae.io.TrfDatabase.connected`

**property** `TrfDatabase.connected: bool`  
Check if connected to SQLite database.

**Return type** `bool`

#### `vallenae.io.TrfDatabase.filename`

**property** `TrfDatabase.filename: str`  
Filename of database.

**Return type** `str`

#### Methods

<code>__init__(filename[, mode])</code>	Open trfdb database file.
<code>close()</code>	Close database connection.
<code>columns()</code>	Columns of data table.
<code>connection()</code>	Get SQLite connection object.
<code>create(filename)</code>	Create empty trfdb.
<code>fieldinfo()</code>	Read fieldinfo table.
<code>globalinfo()</code>	Read globalinfo table.
<code>iread(*[, trai, query_filter])</code>	Stream features with returned iterable.
<code>listen([existing, wait, query_filter])</code>	Listen to database changes and return new records.
<code>read(**kwargs)</code>	Read features to Pandas DataFrame.
<code>rows()</code>	Number of rows in data table.
<code>tables()</code>	Get table names.
<code>write(feature_set)</code>	Write feature record to trfdb.
<code>write_fieldinfo(field, info)</code>	Write to fieldinfo table.

**vallenae.io.TrfDatabase.\_\_init\_\_**

`TrfDatabase.__init__(filename, mode='ro')`  
 Open trfdb database file.

**Parameters**

- **filename** (`str`) – Path to trfdb database file
- **mode** (`str`) – Define database access: “ro” (read-only), “rw” (read-write), “rwc” (read-write and create empty database if it does not exist)

**vallenae.io.TrfDatabase.close**

`TrfDatabase.close()`  
 Close database connection.

**vallenae.io.TrfDatabase.columns**

`TrfDatabase.columns()`  
 Columns of data table.

**Return type** `Tuple[str, ...]`

**vallenae.io.TrfDatabase.connection**

`TrfDatabase.connection()`  
 Get SQLite connection object.

**Raises** `RuntimeError` – If connection is closed

**Return type** `Connection`

**vallenae.io.TrfDatabase.create**

**static** `TrfDatabase.create(filename)`  
 Create empty trfdb.

**Parameters** **filename** (`str`) – Path to new trfdb database file

**vallenae.io.TrfDatabase.fieldinfo**

`TrfDatabase.fieldinfo()`  
 Read fieldinfo table.

The fieldinfo table stores informations about columns of the data table (like units).

**Return type** `Dict[str, Dict[str, Any]]`

**Returns** Dict of column names and informations (again a dict)

**vallenae.io.TrfDatabase.globalinfo****TrfDatabase.globalinfo()**

Read globalinfo table.

**Return type** `Dict[str, Any]`**vallenae.io.TrfDatabase.iread****TrfDatabase.iread**(*\**, *trai=None*, *query\_filter=None*)

Stream features with returned iterable.

**Parameters**

- **trai** (`Union[None, int, Sequence[int]]`) – Read data by TRAI (transient recorder index)
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “FFT\_CoG >= 150 AND CTP < 20”

**Return type** `SizedIterable[FeatureRecord]`**Returns** Sized iterable to sequential read features**vallenae.io.TrfDatabase.listen****TrfDatabase.listen**(*existing=False*, *wait=False*, *query\_filter=None*)

Listen to database changes and return new records.

**Parameters**

- **existing** (`bool`) – Return already existing records
- **wait** (`bool`) – Wait for new records even if no acquisition (writer) is active. Otherwise the function returns after all records are read.
- **query\_filter** (`Optional[str]`) – Optional query filter provided as SQL clause, e.g. “TRAI >= 100”

**Yields** New feature records**Return type** `Iterable[FeatureRecord]`**vallenae.io.TrfDatabase.read****TrfDatabase.read**(*\*\*kwargs*)

Read features to Pandas DataFrame.

**Parameters** **\*\*kwargs** – Arguments passed to *iread***Return type** `DataFrame`**Returns** Pandas DataFrame with features

**vallenae.io.TrfDatabase.rows**

`TrfDatabase.rows()`  
Number of rows in data table.

**Return type** `int`

**vallenae.io.TrfDatabase.tables**

`TrfDatabase.tables()`  
Get table names.

**Return type** `Set[str]`

**vallenae.io.TrfDatabase.write**

`TrfDatabase.write(feature_set)`  
Write feature record to trfdb.

**Parameters** `feature_set` (*FeatureRecord*) – Feature set

**Return type** `int`

**Returns** Index (traí) of inserted row

**vallenae.io.TrfDatabase.write\_fieldinfo**

`TrfDatabase.write_fieldinfo(field, info)`  
Write to fieldinfo table.

**Parameters**

- **field** (`str`) – Column name of data table
- **info** (`Dict[str, Any]`) – Dict of properties and values, e.g. {"Unit": "[Hz]"}

**Raises** `ValueError` – If field is not a column of data table

All database classes implement two different interfaces to access data:

**Standard read\_\***

Read data to `pandas.DataFrame`, e.g. with `PriDatabase.read_hits`

```
>>> pridb = vae.io.PriDatabase("./examples/steel_plate/sample.pridb")
>>> df = pridb.read_hits() # save all hits to pandas dataframe
>>> df[["time", "channel"]] # output columns hit and channel
      time  channel
set_id
10      3.992771      3
11      3.992775      2
12      3.992813      4
13      3.992814      1
```

**Streaming iread\_\***

Iterate through the data row by row. This is a memory-efficient solution ideal for batch processing. The return types are specific `typing.NamedTuple`, see *Data types*.

Example with `PriDatabase.iread_hits`:

```
>>> prddb = vae.io.PriDatabase("./examples/steel_plate/sample.prddb")
>>> for hit in prddb.iread_hits():
...     print(f"time: {hit.time:0.4f}, channel: {hit.channel}")
...
time: 3.9928,    channel: 3
time: 3.9928,    channel: 2
time: 3.9928,    channel: 4
time: 3.9928,    channel: 1
>>> type(hit)
<class 'vallenae.io.datatypes.HitRecord'>
```

## 1.2 Data types

Records of the database are represented as `typing.NamedTuple`. Each record implements a class method `from_sql` to init from a SQLite row dictionary (column name: value).

<code>HitRecord</code> (time, channel, param_id, ...)	Hit record in prddb (SetType = 2).
<code>MarkerRecord</code> (time, set_type, data, number, ...)	Marker record in prddb (SetType = 4, 5, 6).
<code>StatusRecord</code> (time, channel, param_id, ...)	Status data record in prddb (SetType = 3).
<code>ParametricRecord</code> (time, param_id, set_id, ...)	Parametric data record in prddb (SetType = 1).
<code>TraRecord</code> (time, channel, param_id, ...)	Transient data record in tradb.
<code>FeatureRecord</code> (tra, features, float)	Transient feature record in trfdb.

### 1.2.1 vallenae.io.HitRecord

**class** `vallenae.io.HitRecord`(time: *float*, channel: *int*, param\_id: *int*, amplitude: *float*, duration: *float*, energy: *float*, rms: *float*, set\_id: *Optional[int]* = None, threshold: *Optional[float]* = None, rise\_time: *Optional[float]* = None, signal\_strength: *Optional[float]* = None, counts: *Optional[int]* = None, tra: *Optional[int]* = None, cascade\_hits: *Optional[int]* = None, cascade\_counts: *Optional[int]* = None, cascade\_energy: *Optional[int]* = None, cascade\_signal\_strength: *Optional[int]* = None)

Hit record in prddb (SetType = 2).

#### Attributes

<code>amplitude</code>	Peak amplitude in volts
<code>cascade_counts</code>	Summed counts of hits in the same hit-cascade
<code>cascade_energy</code>	Summed energy of hits in the same hit-cascade
<code>cascade_hits</code>	Total number of hits in the same hit-cascade
<code>cascade_signal_strength</code>	disable=line-too-long
<code>channel</code>	Channel number
<code>counts</code>	Number of positive threshold crossings
<code>duration</code>	Hit duration in seconds

continues on next page

Table 9 – continued from previous page

<i>energy</i>	Energy (EN 1330-9) in eu ( $1\text{e-}14\text{ V}^2\text{s}$ )
<i>param_id</i>	Parameter ID of table ae_params for ADC value conversion
<i>rise_time</i>	Rise time in seconds
<i>rms</i>	RMS of the noise before the hit in volts
<i>set_id</i>	Unique identifier for data set in pridb
<i>signal_strength</i>	Signal strength in nVs ( $1\text{e-}9\text{ Vs}$ )
<i>threshold</i>	Threshold amplitude in volts
<i>time</i>	Time in seconds
<i>traid</i>	Transient recorder index (foreign key between pridb and tradb)

**vallenae.io.HitRecord.amplitude****property** HitRecord.amplitude

Peak amplitude in volts

**vallenae.io.HitRecord.cascade\_counts****property** HitRecord.cascade\_counts

Summed counts of hits in the same hit-cascade

**vallenae.io.HitRecord.cascade\_energy****property** HitRecord.cascade\_energy

Summed energy of hits in the same hit-cascade

**vallenae.io.HitRecord.cascade\_hits****property** HitRecord.cascade\_hits

Total number of hits in the same hit-cascade

**vallenae.io.HitRecord.cascade\_signal\_strength****property** HitRecord.cascade\_signal\_strength

disable=line-too-long

**Type** Summed signal strength of hits in the same hit-cascade # noqa # pylint**vallenae.io.HitRecord.channel****property** HitRecord.channel

Channel number

#### **vallena.io.HitRecord.counts**

**property** HitRecord.counts  
Number of positive threshold crossings

#### **vallena.io.HitRecord.duration**

**property** HitRecord.duration  
Hit duration in seconds

#### **vallena.io.HitRecord.energy**

**property** HitRecord.energy  
Energy (EN 1330-9) in eu ( $1e-14 \text{ V}^2\text{s}$ )

#### **vallena.io.HitRecord.param\_id**

**property** HitRecord.param\_id  
Parameter ID of table ae\_params for ADC value conversion

#### **vallena.io.HitRecord.rise\_time**

**property** HitRecord.rise\_time  
Rise time in seconds

#### **vallena.io.HitRecord.rms**

**property** HitRecord.rms  
RMS of the noise before the hit in volts

#### **vallena.io.HitRecord.set\_id**

**property** HitRecord.set\_id  
Unique identifier for data set in pridb

#### **vallena.io.HitRecord.signal\_strength**

**property** HitRecord.signal\_strength  
Signal strength in nVs ( $1e-9 \text{ Vs}$ )

**vallenae.io.HitRecord.threshold**

**property** `HitRecord.threshold`  
Threshold amplitude in volts

**vallenae.io.HitRecord.time**

**property** `HitRecord.time`  
Time in seconds

**vallenae.io.HitRecord.trai**

**property** `HitRecord.trai`  
Transient recorder index (foreign key between pridb and tradb)

**Methods**

---

`__init__()`

---

<code>count(value, /)</code>	Return number of occurrences of value.
------------------------------	--

<code>from_sql(row)</code>	Create HitRecord from SQL row.
----------------------------	--------------------------------

<code>index(value[, start, stop])</code>	Return first index of value.
--	------------------------------

---

**vallenae.io.HitRecord.\_\_init\_\_**

`HitRecord.__init__()`

**vallenae.io.HitRecord.count**

`HitRecord.count(value, /)`  
Return number of occurrences of value.

**vallenae.io.HitRecord.from\_sql**

**classmethod** `HitRecord.from_sql(row)`  
Create HitRecord from SQL row.

**Parameters** `row` (`Dict[str, Any]`) – Dict of column names and values

**Return type** `HitRecord`

**vallenae.io.HitRecord.index**

**HitRecord.index**(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

**1.2.2 vallenae.io.MarkerRecord**

**class** vallenae.io.**MarkerRecord**(*time*: *float*, *set\_type*: *int*, *data*: *str*, *number*: *Optional[int]* = None, *set\_id*: *Optional[int]* = None)

Marker record in pridb (SetType = 4, 5, 6).

A marker can have different meanings depending on its SetType:

- 4: label
- 5: datetime data set, as it is inserted whenever recording is started by software
- 6: a section start marker. E.g. new sections are started, if acquisition settings changed

**Attributes**

<i>data</i>	Content of marker (label text or datetime)
<i>number</i>	Marker number
<i>set_id</i>	Unique identifier for data set in pridb
<i>set_type</i>	Marker type (see above)
<i>time</i>	Time in seconds

**vallenae.io.MarkerRecord.data**

**property** MarkerRecord.**data**

Content of marker (label text or datetime)

**vallenae.io.MarkerRecord.number**

**property** MarkerRecord.**number**

Marker number

**vallenae.io.MarkerRecord.set\_id**

**property** MarkerRecord.**set\_id**

Unique identifier for data set in pridb

**vallenae.io.MarkerRecord.set\_type**

**property** MarkerRecord.**set\_type**  
 Marker type (see above)

**vallenae.io.MarkerRecord.time**

**property** MarkerRecord.**time**  
 Time in seconds

**Methods**

---

`__init__()`

<code>count(value, /)</code>	Return number of occurrences of value.
<code>from_sql(row)</code>	Create MarkerRecord from SQL row.
<code>index(value[, start, stop])</code>	Return first index of value.

---

**vallenae.io.MarkerRecord.\_\_init\_\_**

MarkerRecord.**\_\_init\_\_**()

**vallenae.io.MarkerRecord.count**

MarkerRecord.**count**(*value*, /)  
 Return number of occurrences of value.

**vallenae.io.MarkerRecord.from\_sql**

**classmethod** MarkerRecord.**from\_sql**(*row*)  
 Create MarkerRecord from SQL row.

**Parameters** *row* (`Dict[str, Any]`) – Dict of column names and values

**Return type** *MarkerRecord*

**vallenae.io.MarkerRecord.index**

MarkerRecord.**index**(*value*, *start*=0, *stop*=9223372036854775807, /)  
 Return first index of value.

Raises ValueError if the value is not present.

### 1.2.3 vallenae.io.StatusRecord

```
class vallenae.io.StatusRecord(time: float, channel: int, param_id: int, energy: float, rms: float, set_id:  
                               Optional[int] = None, threshold: Optional[float] = None, signal_strength:  
                               Optional[float] = None)
```

Status data record in prddb (SetType = 3).

#### Attributes

<i>channel</i>	Channel number
<i>energy</i>	Energy (EN 1330-9) in eu (1e-14 V <sup>2</sup> s)
<i>param_id</i>	Parameter ID of table ae_params for ADC value conversion
<i>rms</i>	RMS in volts
<i>set_id</i>	Unique identifier for data set in prddb
<i>signal_strength</i>	Signal strength in nVs (1e-9 Vs)
<i>threshold</i>	Threshold amplitude in volts
<i>time</i>	Time in seconds

#### vallenae.io.StatusRecord.channel

**property** StatusRecord.**channel**  
Channel number

#### vallenae.io.StatusRecord.energy

**property** StatusRecord.**energy**  
Energy (EN 1330-9) in eu (1e-14 V<sup>2</sup>s)

#### vallenae.io.StatusRecord.param\_id

**property** StatusRecord.**param\_id**  
Parameter ID of table ae\_params for ADC value conversion

#### vallenae.io.StatusRecord.rms

**property** StatusRecord.**rms**  
RMS in volts

**vallenae.io.StatusRecord.set\_id**

**property** StatusRecord.**set\_id**  
Unique identifier for data set in pridb

**vallenae.io.StatusRecord.signal\_strength**

**property** StatusRecord.**signal\_strength**  
Signal strength in nVs (1e-9 Vs)

**vallenae.io.StatusRecord.threshold**

**property** StatusRecord.**threshold**  
Threshold amplitude in volts

**vallenae.io.StatusRecord.time**

**property** StatusRecord.**time**  
Time in seconds

**Methods**

---

*\_\_init\_\_()*

---

<i>count</i> (value, /)	Return number of occurrences of value.
-------------------------	--

---

<i>from_sql</i> (row)	Create StatusRecord from SQL row.
-----------------------	-----------------------------------

---

<i>index</i> (value[, start, stop])	Return first index of value.
-------------------------------------	------------------------------

---

**vallenae.io.StatusRecord.\_\_init\_\_**

StatusRecord.**\_\_init\_\_**()

**vallenae.io.StatusRecord.count**

StatusRecord.**count**(value, /)  
Return number of occurrences of value.

**vallenae.io.StatusRecord.from\_sql**

**classmethod** StatusRecord.**from\_sql**(row)  
Create StatusRecord from SQL row.

**Parameters** **row** (Dict[str, Any]) – Dict of column names and values

**Return type** *StatusRecord*

### vallenae.io.StatusRecord.index

StatusRecord.**index**(value, start=0, stop=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

## 1.2.4 vallenae.io.ParametricRecord

```
class vallenae.io.ParametricRecord(time: float, param_id: int, set_id: Optional[int] = None, pcta: Optional[int] = None, pcta: Optional[int] = None, pa0: Optional[int] = None, pa1: Optional[int] = None, pa2: Optional[int] = None, pa3: Optional[int] = None, pa4: Optional[int] = None, pa5: Optional[int] = None, pa6: Optional[int] = None, pa7: Optional[int] = None)
```

Parametric data record in prddb (SetType = 1).

### Attributes

<i>pa0</i>	Amplitude of parametric input 0 in volts
<i>pa1</i>	Amplitude of parametric input 1 in volts
<i>pa2</i>	Amplitude of parametric input 2 in volts
<i>pa3</i>	Amplitude of parametric input 3 in volts
<i>pa4</i>	Amplitude of parametric input 4 in volts
<i>pa5</i>	Amplitude of parametric input 5 in volts
<i>pa6</i>	Amplitude of parametric input 6 in volts
<i>pa7</i>	Amplitude of parametric input 7 in volts
<i>param_id</i>	Parameter ID of table ae_params for ADC value conversion
<i>pcta</i>	Analog hysteresis counter
<i>pcta</i>	Digital counter value
<i>set_id</i>	Unique identifier for data set in prddb
<i>time</i>	Time in seconds

### vallenae.io.ParametricRecord.pa0

**property** ParametricRecord.pa0

Amplitude of parametric input 0 in volts

**vallenae.io.ParametricRecord.pa1****property** ParametricRecord.pa1

Amplitude of parametric input 1 in volts

**vallenae.io.ParametricRecord.pa2****property** ParametricRecord.pa2

Amplitude of parametric input 2 in volts

**vallenae.io.ParametricRecord.pa3****property** ParametricRecord.pa3

Amplitude of parametric input 3 in volts

**vallenae.io.ParametricRecord.pa4****property** ParametricRecord.pa4

Amplitude of parametric input 4 in volts

**vallenae.io.ParametricRecord.pa5****property** ParametricRecord.pa5

Amplitude of parametric input 5 in volts

**vallenae.io.ParametricRecord.pa6****property** ParametricRecord.pa6

Amplitude of parametric input 6 in volts

**vallenae.io.ParametricRecord.pa7****property** ParametricRecord.pa7

Amplitude of parametric input 7 in volts

**vallenae.io.ParametricRecord.param\_id****property** ParametricRecord.param\_id

Parameter ID of table ae\_params for ADC value conversion

**vallenae.io.ParametricRecord.pcta**

**property** ParametricRecord.**pcta**  
Analog hysteresis counter

**vallenae.io.ParametricRecord.pctd**

**property** ParametricRecord.**pctd**  
Digital counter value

**vallenae.io.ParametricRecord.set\_id**

**property** ParametricRecord.**set\_id**  
Unique identifier for data set in pridb

**vallenae.io.ParametricRecord.time**

**property** ParametricRecord.**time**  
Time in seconds

**Methods**

---

**`__init__()`**

---

<b><code>count(value, /)</code></b>	Return number of occurrences of value.
<b><code>from_sql(row)</code></b>	Create ParametricRecord from SQL row.
<b><code>index(value[, start, stop])</code></b>	Return first index of value.

---

**vallenae.io.ParametricRecord.\_\_init\_\_**

ParametricRecord.**`__init__()`**

**vallenae.io.ParametricRecord.count**

ParametricRecord.**`count(value, /)`**  
Return number of occurrences of value.

**vallenae.io.ParametricRecord.from\_sql**

**classmethod** ParametricRecord.**`from_sql(row)`**  
Create ParametricRecord from SQL row.

**Parameters** **row** (`Dict[str, Any]`) – Dict of column names and values

**Return type** `ParametricRecord`

**vallenae.io.ParametricRecord.index**

**ParametricRecord.index**(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

**1.2.5 vallenae.io.TraRecord**

**class** vallenae.io.**TraRecord**(*time*: *float*, *channel*: *int*, *param\_id*: *int*, *pretrigger*: *int*, *threshold*: *float*, *samplerate*: *int*, *samples*: *int*, *data*: *numpy.ndarray*, *trai*: *Optional[int]* = None, *rms*: *Optional[float]* = None)

Transient data record in tradb.

---

**Todo:** Remove RMS

---

**Attributes**

<i>channel</i>	Channel number
<i>data</i>	Transient signal in volts
<i>param_id</i>	Parameter ID of table tr_params for ADC value conversion
<i>pretrigger</i>	Pretrigger samples
<i>rms</i>	RMS of the noise before the hit
<i>samplerate</i>	Samplerate in Hz
<i>samples</i>	Number of samples
<i>threshold</i>	Threshold amplitude in volts
<i>time</i>	Time in seconds
<i>trai</i>	Transient recorder index (foreign key between pridb and tradb)

**vallenae.io.TraRecord.channel**

**property** TraRecord.**channel**

Channel number

### **vallena.io.TraRecord.data**

**property** TraRecord.**data**  
Transient signal in volts

### **vallena.io.TraRecord.param\_id**

**property** TraRecord.**param\_id**  
Parameter ID of table tr\_params for ADC value conversion

### **vallena.io.TraRecord.pretrigger**

**property** TraRecord.**pretrigger**  
Pretrigger samples

### **vallena.io.TraRecord.rms**

**property** TraRecord.**rms**  
RMS of the noise before the hit

### **vallena.io.TraRecord.samplerate**

**property** TraRecord.**samplerate**  
Samplerate in Hz

### **vallena.io.TraRecord.samples**

**property** TraRecord.**samples**  
Number of samples

### **vallena.io.TraRecord.threshold**

**property** TraRecord.**threshold**  
Threshold amplitude in volts

### **vallena.io.TraRecord.time**

**property** TraRecord.**time**  
Time in seconds

**vallenae.io.TraRecord.trai****property** TraRecord.trai

Transient recorder index (foreign key between pridb and tradb)

**Methods**

---

`__init__()`

---

`count(value, /)`

Return number of occurrences of value.

---

`from_sql(row)`

**rtype** TraRecord

---

`index(value[, start, stop])`

Return first index of value.

---

**vallenae.io.TraRecord.\_\_init\_\_**

TraRecord.\_\_init\_\_()

**vallenae.io.TraRecord.count**

TraRecord.count(*value*, /)

Return number of occurrences of value.

**vallenae.io.TraRecord.from\_sql**

**classmethod** TraRecord.from\_sql(*row*)

**Return type** TraRecord

**vallenae.io.TraRecord.index**

TraRecord.index(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

**1.2.6 vallenae.io.FeatureRecord**

**class** vallenae.io.FeatureRecord(*trai*: int, *features*: Dict[str, float])

Transient feature record in trfdb.

## Attributes

<i>features</i>	Feature dictionary (feature name -> value)
<i>trai</i>	Transient recorder index

### **vallenae.io.FeatureRecord.features**

**property** FeatureRecord.**features**  
Feature dictionary (feature name -> value)

### **vallenae.io.FeatureRecord.trai**

**property** FeatureRecord.**trai**  
Transient recorder index

## Methods

<i>__init__</i> ()	
<i>count</i> (value, /)	Return number of occurrences of value.
<i>from_sql</i> (row)	<b>rtype</b> <i>FeatureRecord</i>
<i>index</i> (value[, start, stop])	Return first index of value.

### **vallenae.io.FeatureRecord.\_\_init\_\_**

FeatureRecord.**\_\_init\_\_**()

### **vallenae.io.FeatureRecord.count**

FeatureRecord.**count**(value, /)  
Return number of occurrences of value.

### **vallenae.io.FeatureRecord.from\_sql**

**classmethod** FeatureRecord.**from\_sql**(row)

**Return type** *FeatureRecord*

**vallenae.io.FeatureRecord.index**

`FeatureRecord.index(value, start=0, stop=9223372036854775807, /)`

Return first index of value.

Raises `ValueError` if the value is not present.

## 1.3 Compression

Transient signals in the tradb are stored as BLOBs of 16-bit ADC values – either uncompressed or compressed (**FLAC**). Following functions convert between BLOBs and arrays of voltage values.

<code>decode_data_blob(data_blob, data_format, ...)</code>	Decodes (compressed) 16-bit ADC values from BLOB to array of voltage values.
<code>encode_data_blob(data, data_format, ...)</code>	Encodes array of voltage values to BLOB of 16-bit ADC values for memory-efficient storage.

### 1.3.1 vallenae.io.decode\_data\_blob

`vallenae.io.decode_data_blob(data_blob, data_format, factor_millivolts)`

Decodes (compressed) 16-bit ADC values from BLOB to array of voltage values.

**Parameters**

- **data\_blob** (`bytes`) – Blob from tradb
- **data\_format** (`int`) –
  - 0: uncompressed
  - 2: FLAC compression
- **factor\_millivolts** (`float`) – Factor from int16 representation to millivolts. Stored in tradb -> tr\_params as 'TR\_mV'

**Return type** `ndarray`

**Returns** Array of voltage values

### 1.3.2 vallenae.io.encode\_data\_blob

`vallenae.io.encode_data_blob(data, data_format, factor_millivolts)`

Encodes array of voltage values to BLOB of 16-bit ADC values for memory-efficient storage.

**Parameters**

- **data** (`ndarray`) – Array with voltage values
- **data\_format** (`int`) –
  - 0: uncompressed
  - 2: FLAC compression
- **factor\_millivolts** (`float`) – Factor from int16 representation to millivolts. Stored in tradb -> tr\_params as 'TR\_mV'

**Return type** `bytes`

**Returns** Data blob

## FEATURES

## 2.1 Acoustic Emission

<code>peak_amplitude(data)</code>	Compute maximum absolute amplitude.
<code>peak_amplitude_index(data)</code>	Compute index of peak amplitude.
<code>is_above_threshold(data, threshold)</code>	Checks if absolute amplitudes are above threshold.
<code>first_threshold_crossing(data, threshold)</code>	Compute index of first threshold crossing.
<code>rise_time(data, threshold, samplerate[, ...])</code>	Compute the rise time.
<code>energy(data, samplerate)</code>	Compute the energy of a hit.
<code>signal_strength(data, samplerate)</code>	Compute the signal strength of a hit.
<code>counts(data, threshold)</code>	Compute the number of positive threshold crossings of a hit (counts).
<code>rms(data)</code>	Compute the root mean square (RMS) of an array.

### 2.1.1 `vallенае.features.peak_amplitude`

`vallенае.features.peak_amplitude(data)`

Compute maximum absolute amplitude.

**Parameters** `data` (`ndarray`) – Input array

**Return type** `float`

**Returns** Peak amplitude of the input array

### 2.1.2 `vallенае.features.peak_amplitude_index`

`vallенае.features.peak_amplitude_index(data)`

Compute index of peak amplitude.

**Parameters** `data` (`ndarray`) – Input array

**Return type** `int`

**Returns** Index of peak amplitude

### 2.1.3 vallenae.features.is\_above\_threshold

`vallenae.features.is_above_threshold(data, threshold)`

Checks if absolute amplitudes are above threshold.

**Parameters**

- **data** (`ndarray`) – Input array
- **threshold** (`float`) – Threshold amplitude

**Return type** `bool`

**Returns** True if input array is above threshold, otherwise False

### 2.1.4 vallenae.features.first\_threshold\_crossing

`vallenae.features.first_threshold_crossing(data, threshold)`

Compute index of first threshold crossing.

**Parameters**

- **data** (`ndarray`) – Input array
- **threshold** (`float`) – Threshold amplitude

**Return type** `Optional[int]`

**Returns** Index of first threshold crossing. None if threshold was not exceeded

### 2.1.5 vallenae.features.rise\_time

`vallenae.features.rise_time(data, threshold, samplerate, first_crossing=None, index_peak=None)`

Compute the rise time.

The rise time is the time between the first threshold crossing and the peak amplitude.

**Parameters**

- **data** (`ndarray`) – Input array (hit)
- **threshold** (`float`) – Threshold amplitude (in volts)
- **samplerate** (`int`) – Sample rate of the input array
- **first\_crossing** (`Optional[int]`) – Precomputed index of first threshold crossing to save computation time
- **index\_peak** (`Optional[int]`) – Precomputed index of peak amplitude to save computation time

**Return type** `float`

### 2.1.6 vallenae.features.energy

`vallenae.features.energy(data, samplerate)`

Compute the energy of a hit.

Energy is the integral of the squared AE-signal over time (EN 1330-9). The unit of energy is eu. 1 eu corresponds to  $1e-14 \text{ V}^2\text{s}$ .

**Parameters**

- **data** (`ndarray`) – Input array (hit)
- **samplerate** (`int`) – Sample rate of input array in Hz

**Return type** `float`

**Returns** Energy of input array (hit)

### 2.1.7 vallenae.features.signal\_strength

`vallenae.features.signal_strength(data, samplerate)`

Compute the signal strength of a hit.

Signal strength is the integral of the rectified AE-signal over time. The unit of Signal Strength is nVs ( $1e-9 \text{ Vs}$ ).

**Parameters**

- **data** (`ndarray`) – Input array (hit)
- **samplerate** (`int`) – Sample rate of input array in Hz

**Return type** `float`

**Returns** Signal strength of input array (hit)

### 2.1.8 vallenae.features.counts

`vallenae.features.counts(data, threshold)`

Compute the number of positive threshold crossings of a hit (counts).

**Parameters**

- **data** (`ndarray`) – Input array
- **threshold** (`float`) – Threshold amplitude

**Return type** `int`

**Returns** Number of positive threshold crossings

## 2.1.9 vallenae.features.rms

`vallenae.features.rms(data)`

Compute the root mean square (RMS) of an array.

**Parameters** `data` (`ndarray`) – Input array

**Return type** `float`

**Returns** RMS of the input array

### References

[https://en.wikipedia.org/wiki/Root\\_mean\\_square](https://en.wikipedia.org/wiki/Root_mean_square)

## 2.2 Conversion

---

<code>amplitude_to_db(amplitude[, reference])</code>	Convert amplitude from volts to decibel (dB).
<code>db_to_amplitude(amplitude_db[, reference])</code>	Convert amplitude from decibel (dB) to volts.

---

### 2.2.1 vallenae.features.amplitude\_to\_db

`vallenae.features.amplitude_to_db(amplitude, reference=1e-06)`

Convert amplitude from volts to decibel (dB).

#### Parameters

- **amplitude** (`float`) – Amplitude in volts
- **reference** (`float`) – Reference amplitude. Defaults to 1  $\mu$ V for dB(AE)

**Return type** `float`

**Returns** Amplitude in dB(ref)

### 2.2.2 vallenae.features.db\_to\_amplitude

`vallenae.features.db_to_amplitude(amplitude_db, reference=1e-06)`

Convert amplitude from decibel (dB) to volts.

#### Parameters

- **amplitude\_db** (`float`) – Amplitude in dB
- **reference** (`float`) – Reference amplitude. Defaults to 1  $\mu$ V for dB(AE)

**Return type** `float`

**Returns** Amplitude in volts

## TIMERPICKER

The determination of signal arrival times has a major influence on the localization accuracy. Usually, arrival times are determined by the first threshold crossing (either fixed or adaptive). Following popular methods have been proposed in the past to automatically pick time of arrivals:

<code>hinkley(arr[, alpha])</code>	Hinkley criterion for arrival time estimation.
<code>aic(arr)</code>	Akaike Information Criterion (AIC) for arrival time estimation.
<code>energy_ratio(arr[, win_len])</code>	Energy ratio for arrival time estimation.
<code>modified_energy_ratio(arr[, win_len])</code>	Modified energy ratio method for arrival time estimation.

### 3.1 `vallena.timepicker.hinkley`

`vallena.timepicker.hinkley(arr, alpha=5)`

Hinkley criterion for arrival time estimation.

The Hinkley criterion is defined as the partial energy of the signal (cumulative square sum) with an applied negative trend (characterized by alpha).

The starting value of alpha is reduced iteratively to avoid wrong picks within the pre-trigger part of the signal. Usually alpha values are chosen to be between 2 and 200 to ensure minimal delay. The chosen alpha value for the Hinkley criterion influences the results significantly.

#### Parameters

- **arr** (`ndarray`) – Transient signal of hit
- **alpha** (`int`) – Divisor of the negative trend. Default: 5

**Return type** `Tuple[ndarray, int]`

#### Returns

- Array with computed detection function
- Index of the estimated arrival time (max value)

---

**Todo:** Weak performance, if used with default parameter alpha

---

- van Rijn, N. (2017). Investigating the Behaviour of Acoustic Emission Waves Near Cracks: Using the Finite Element Method. Delft University of Technology.

## 3.2 vallenae.timepicker.aic

`vallenae.timepicker.aic(arr)`

Akaike Information Criterion (AIC) for arrival time estimation.

The AIC picker basically models the signal as an autoregressive (AR) process. A typical AE signal can be subdivided into two parts. The first part containing noise and the second part containing noise and the AE signal. Both parts of the signal contain non deterministic parts (noise) describable by a Gaussian distribution.

**Parameters** `arr` (`ndarray`) – Transient signal of hit

**Return type** `Tuple[ndarray, int]`

### Returns

- Array with computed detection function
- Index of the estimated arrival time (max value)

## References

- Molenda, M. (2016). Acoustic Emission monitoring of laboratory hydraulic fracturing experiments. Ruhr-Universität Bochum.

## 3.3 vallenae.timepicker.energy\_ratio

`vallenae.timepicker.energy_ratio(arr, win_len=100)`

Energy ratio for arrival time estimation.

Method based on preceding and following energy collection windows.

### Parameters

- `arr` (`ndarray`) – Transient signal of hit
- `win_len` (`int`) – Samples of sliding windows. Default: 100

**Return type** `Tuple[ndarray, int]`

### Returns

- Array with computed detection function
- Index of the estimated arrival time (max value)

## References

- Han, L., Wong, J., & Bancroft, J. C. (2009). Time picking and random noise reduction on microseismic data. CREWES Research Report, 21, 1–13.

## 3.4 vallenae.timepicker.modified\_energy\_ratio

`vallenae.timepicker.modified_energy_ratio(arr, win_len=100)`

Modified energy ratio method for arrival time estimation.

The modifications improve the ability to detect the onset of a seismic arrival in the presence of random noise.

### Parameters

- **arr** (`ndarray`) – Transient signal of hit
- **win\_len** (`int`) – Samples of sliding windows. Default: 100

**Return type** `Tuple[ndarray, int]`

### Returns

- Array with computed detection function
- Index of the estimated arrival time (max value)

## References

- Han, L., Wong, J., & Bancroft, J. C. (2009). Time picking and random noise reduction on microseismic data. CREWES Research Report, 21, 1–13.

## EXAMPLES

A collection of examples how to read and analyse Acoustic Emission data.

### 4.1 Read prddb

```
import os

import matplotlib.pyplot as plt

import vallengae as vae

HERE = os.path.dirname(__file__) if "__file__" in locals() else os.getcwd()
PRIDB = os.path.join(HERE, "steel_plate/sample.prddb")
```

#### 4.1.1 Open prddb

```
prddb = vae.io.PriDatabase(PRIDB)

print("Tables in database: ", prddb.tables())
print("Number of rows in data table (ae_data): ", prddb.rows())
print("Set of all channels: ", prddb.channel())
```

Out:

```
Tables in database: {'ae_fieldinfo', 'ae_markers', 'ae_params', 'acq_setup', 'ae_data',
↪ 'ae_globalinfo', 'data_integrity'}
Number of rows in data table (ae_data): 18
Set of all channels: {1, 2, 3, 4}
```

### 4.1.2 Read hits to Pandas DataFrame

```
df_hits = pridb.read_hits()
# Print a few columns
print(df_hits[["time", "channel", "amplitude", "counts", "energy"]])
```

Out:

```
Hits: 0%|          | 0/4 [00:00<?, ?it/s]
Hits: 100%|#####| 4/4 [00:00<00:00, 6833.90it/s]
      time  channel  amplitude  counts      energy
set_id
10    3.992771      3    0.046539    2180  2.799510e+07
11    3.992775      2    0.059621    2047  2.276279e+07
12    3.992813      4    0.034119    1854  1.286700e+07
13    3.992814      1    0.029115    1985  1.265275e+07
```

### 4.1.3 Query Pandas DataFrame

DataFrames offer powerful features to query and aggregate data, e.g. plot summed energy per channel

```
ax = df_hits.groupby("channel").sum()["energy"].plot.bar(figsize=(8, 3))
ax.set_xlabel("Channel")
ax.set_ylabel("Summed Energy [eu = 1e-14 V²s]")
plt.tight_layout()
plt.show()
```

#### 4.1.4 Read markers

```
df_markers = pridb.read_markers()
print(df_markers)
```

Out:

```
Marker: 0%|          | 0/5 [00:00<?, ?it/s]
Marker: 100%|#####| 5/5 [00:00<00:00, 18063.32it/s]
      time  set_type      data  number
set_id
1      0.00        6              1
2      0.00        4      10:52 Resume  1
3      0.00        5      2019-09-20 10:54:52  <NA>
4      0.00        4  TimeZone: +02:00 (W. Europe Standard Time)  2
18     100.07        4      10:56 Suspend  3
```

#### 4.1.5 Read parametric data

```
df_parametric = pridb.read_parametric()
print(df_parametric)
```

Out:

```
Parametric: 0%|          | 0/9 [00:00<?, ?it/s]
Parametric: 100%|#####| 9/9 [00:00<00:00, 17050.02it/s]
      time  param_id  pctd  pcta
set_id
5      0.00        1      0      0
6      1.00        1      0      0
7      2.00        1      0      0
8      3.00        1      0      0
9      3.99        1      0      0
14     4.00        1      0      0
15     5.00        1      0      0
16     6.00        1      0      0
17     6.45        1      0      0
```

**Total running time of the script:** ( 0 minutes 0.401 seconds)

## 4.2 Read and plot transient data

```
import os

import matplotlib.pyplot as plt

import vallenae as vae

HERE = os.path.dirname(__file__) if "__file__" in locals() else os.getcwd()
TRADB = os.path.join(HERE, "steel_plate/sample_plain.tradb") # uncompressed
TRAJ = 4 # just an example, no magic here

def main():
    # Read waveform from tradb
    with vae.io.TraDatabase(TRADB) as tradb:
        y, t = tradb.read_wave(TRAJ)

    y *= 1e3 # in mV
    t *= 1e6 # for μs

    # Plot waveforms
    plt.figure(figsize=(8, 4), tight_layout=True)
    plt.plot(t, y)
    plt.xlabel("Time [μs]")
    plt.ylabel("Amplitude [mV]")
    plt.title(f"Transient Wave Plot; trai = {TRAJ}")
    plt.show()

if __name__ == "__main__":
    main()
```

Total running time of the script: ( 0 minutes 0.361 seconds)

## 4.3 Timepicker

Following example showcases the results of different timepicking methods. For more informations, please refer to the functions documentation ([vallenae.timepicker](#)).

```
import os
import time

import matplotlib.pyplot as plt
import numpy as np

import vallenae as vae

HERE = os.path.dirname(__file__) if "__file__" in locals() else os.getcwd()
TRADB = os.path.join(HERE, "steel_plate/sample_plain.tradb")

TRAI = 4
SAMPLES = 2000

plt.ioff() # Turn interactive mode off; plt.show() is blocking
```

Out:

```
<matplotlib.pyplot._IoffContext object at 0x7fb256c94690>
```

### 4.3.1 Read waveform from tradb

```
tradb = vae.io.TraDatabase(TRADB)

y, t = tradb.read_wave(TRAI)
# crop first samples
t = t[:SAMPLES]
y = y[:SAMPLES]
# unit conversion
t *= 1e6 # convert to μs
y *= 1e3 # convert to mV
```

### 4.3.2 Prepare plotting with time-picker results

```
def plot(t_wave, y_wave, y_picker, index_picker, name_picker):
    _, ax1 = plt.subplots(figsize=(8, 4), tight_layout=True)
    ax1.set_xlabel("Time [μs]")
    ax1.set_ylabel("Amplitude [mV]", color="g")
    ax1.plot(t_wave, y_wave, color="g")
    ax1.tick_params(axis="y", labelcolor="g")

    ax2 = ax1.twinx()
```

(continues on next page)

(continued from previous page)

```

ax2.set_ylabel(f"{name_picker}", color="r")
ax2.plot(t_wave, y_picker, color="r")
ax2.tick_params(axis="y", labelcolor="r")

plt.axvline(t_wave[index_picker], color="k", linestyle=":")
plt.show()

```

### 4.3.3 Hinkley Criterion

```

hc_arr, hc_index = vae.timepicker.hinkley(y, alpha=5)
plot(t, y, hc_arr, hc_index, "Hinkley Criterion")

```

The negative trend correlates to the chosen alpha value and can influence the results strongly. Results with **alpha = 50** (less negative trend):

```

hc_arr, hc_index = vae.timepicker.hinkley(y, alpha=50)
plot(t, y, hc_arr, hc_index, "Hinkley Criterion")

```

#### 4.3.4 Akaike Information Criterion (AIC)

```
aic_arr, aic_index = vae.timepicker.aic(y)
plot(t, y, aic_arr, aic_index, "Akaike Information Criterion")
```

### 4.3.5 Energy Ratio

```
er_arr, er_index = vae.timepicker.energy_ratio(y)
plot(t, y, er_arr, er_index, "Energy Ratio")
```

### 4.3.6 Modified Energy Ratio

```
mer_arr, mer_index = vae.timepicker.modified_energy_ratio(y)
plot(t, y, mer_arr, mer_index, "Modified Energy Ratio")
```

### 4.3.7 Performance comparison

All timepicker implementations are using Numba for just-in-time (JIT) compilations. Usually the first function call is slow, because it will trigger the JIT compiler. To compare the performance to a native or numpy implementation, the average of multiple executions should be compared.

```
def timeit(callable, loops=100):
    time_start = time.perf_counter()
    for _ in range(loops):
        callable()
    return 1e6 * (time.perf_counter() - time_start) / loops # elapsed time in  $\mu$ s

timer_results = {
    "Hinkley": timeit(lambda: vae.timepicker.hinkley(y, 5)),
    "AIC": timeit(lambda: vae.timepicker.aic(y)),
    "Energy Ratio": timeit(lambda: vae.timepicker.energy_ratio(y)),
    "Modified Energy Ratio": timeit(lambda: vae.timepicker.modified_energy_ratio(y)),
}

for name, time in timer_results.items():
    print(f"{name}: {time:0.3f}  $\mu$ s")

plt.figure(figsize=(8, 3), tight_layout=True)
plt.bar(timer_results.keys(), timer_results.values())
plt.ylabel("Time [ $\mu$ s]")
plt.show()
```

Out:

```
Hinkley: 13.170  $\mu$ s
AIC: 188.535  $\mu$ s
Energy Ratio: 22.592  $\mu$ s
Modified Energy Ratio: 26.082  $\mu$ s
```

**Total running time of the script:** ( 0 minutes 5.387 seconds)

## 4.4 Timepicker batch processing

Following examples shows how to stream transient data row by row, compute timepicker results and save the results to a feature database (trfdb).

```
import os
from shutil import copyfile
from tempfile import gettempdir

import matplotlib.pyplot as plt
import pandas as pd

import vallenae as vae

HERE = os.path.dirname(__file__) if "__file__" in locals() else os.getcwd()
TRADB = os.path.join(HERE, "steel_plate/sample_plain.tradb")
TRFDB = os.path.join(HERE, "steel_plate/sample.trfdb")
TRFDB_TMP = os.path.join(gettempdir(), "sample.trfdb")
```

### 4.4.1 Open tradb (readonly) and trfdb (readwrite)

```
copyfile(TRFDB, TRFDB_TMP) # copy trfdb, so we don't overwrite it

tradb = vae.io.TraDatabase(TRADB)
trfdb = vae.io.TrfDatabase(TRFDB_TMP, mode="rw") # allow writing
```

### 4.4.2 Read current trfdb

```
print(trfdb.read())
```

Out:

```
Trf:  0%|          | 0/4 [00:00<?, ?it/s]
Trf: 100%|#####| 4/4 [00:00<00:00, 41120.63it/s]
      FFT_CoG      FFT_FoM      PA  ...  CTP      FI      FR
traid
1      147.705078    134.277344    46.483864  ...   11    222.672058    110.182449
2      144.042969    139.160156    59.450512  ...   35    182.291672     98.019981
3      155.029297    164.794922    33.995209  ...   55    155.191879     95.493233
4      159.912109    139.160156    29.114828  ...   29    181.023727    101.906227

[4 rows x 8 columns]
```

### 4.4.3 Compute arrival time offsets with different timepickers

To improve localisation, time of arrival estimates using the first threshold crossing can be refined with timepickers. Therefore, arrival time offsets between the first threshold crossings and the timepicker results are computed.

```
def dt_from_timepicker(timepicker_func, tra: vae.io.TraRecord):
    # Index of the first threshold crossing is equal to the pretrigger samples
    index_ref = tra.pretrigger
    # Only analyse signal until peak amplitude
    index_peak = vae.features.peak_amplitude_index(tra.data)
    data = tra.data[:index_peak]
    # Get timepicker result
    _, index_timepicker = timepicker_func(data)
    # Compute offset in  $\mu$ s
    dt_us = (index_timepicker - index_ref) * 1e6 / tra.samplerate
    return dt_us
```

Transient data is streamed from the database row by row using `vallenae.io.TraDatabase.iread`. Only one transient data set is loaded into memory at a time. That makes the streaming interface ideal for batch processing. The timepicker results are saved to the trfdb using `vallenae.io.TrfDatabase.write`.

```
for tra in tradb.iread():
    # Calculate arrival time offsets with different timepickers
    feature_set = vae.io.FeatureRecord(
        trai=tra.trai,
        features={
            "ATO_Hinkley": dt_from_timepicker(vae.timepicker.hinkley, tra),
            "ATO_AIC": dt_from_timepicker(vae.timepicker.aic, tra),
            "ATO_ER": dt_from_timepicker(vae.timepicker.energy_ratio, tra),
            "ATO_MER": dt_from_timepicker(vae.timepicker.modified_energy_ratio, tra),
        }
    )
    # Save results to trfdb
    trfdb.write(feature_set)
```

### 4.4.4 Read results from trfdb

```
print(trfdb.read().filter(regex="ATO"))
```

Out:

```
Trf:  0%|          | 0/4 [00:00<?, ?it/s]
Trf: 100%|#####| 4/4 [00:00<00:00, 39756.44it/s]
      ATO_Hinkley  ATO_AIC  ATO_ER  ATO_MER
trai
1           30.4      -1.8    -4.0     29.2
2           36.4      -0.8    -1.0     -0.4
3           67.0      -1.8    -3.2     60.4
4           65.8      -1.0    -2.2     64.2
```

#### 4.4.5 Plot results

```
ax = trfdb.read()[["ATO_Hinkley", "ATO_AIC", "ATO_ER", "ATO_MER"]].plot.barh()
ax.invert_yaxis()
ax.set_xlabel("Arrival time offset [ $\mu$ s]")
plt.show()
```

Out:

```
Trf: 0%|          | 0/4 [00:00<?, ?it/s]
Trf: 100%|#####| 4/4 [00:00<00:00, 49784.02it/s]
```

#### 4.4.6 Plot waveforms and arrival times

```
_, axes = plt.subplots(4, 1, tight_layout=True, figsize=(8, 8))
for row, ax in zip(trfdb.read().itertuples(), axes):
    traí = row.Index

    # read waveform from tradb
    y, t = tradb.read_wave(traí)

    # plot waveform
```

(continues on next page)

(continued from previous page)

```
ax.plot(t[400:1000] * 1e6, y[400:1000] * 1e3, "k") # crop and convert to  $\mu$ s/mV
ax.set_title(f"tra_i = {tra_i}")
ax.set_xlabel("Time [ $\mu$ s]")
ax.set_ylabel("Amplitude [mV]")
ax.label_outer()
# plot arrival time offsets
ax.axvline(row.ATO_Hinkley, color="C0")
ax.axvline(row.ATO_AIC, color="C1")
ax.axvline(row.ATO_ER, color="C2")
ax.axvline(row.ATO_MER, color="C3")

axes[0].legend(["Waveform", "Hinkley", "AIC", "ER", "MER"])
plt.show()
```

Out:

```
Trf: 0%|          | 0/4 [00:00<?, ?it/s]
Trf: 100%|#####| 4/4 [00:00<00:00, 41943.04it/s]
```

### 4.4.7 Use results in VisualAE

The computed arrival time offsets can be directly used in VisualAE. We only need to specify the unit. VisualAE requires them to be in  $\mu\text{s}$ . Units and other column-related meta data is saved in the `trf_fieldinfo` table. Field infos can be retrieved with `vallenae.io.TrfDatabase.fieldinfo`:

```
print(trfdb.fieldinfo())
```

Out:

```
{'FFT_CoG': {'SetTypes': 2, 'Unit': '[kHz]', 'LongName': 'F(C.o.Gravity)', 'Description': 'Center of gravity of spectrum', 'ShortName': None, 'FormatStr': None}, 'FFT_FoM': {'SetTypes': 2, 'Unit': '[kHz]', 'LongName': 'F(max. Amp.)', 'Description': 'Frequency of maximum of spectrum', 'ShortName': None, 'FormatStr': None}, 'PA': {'SetTypes': 8, 'Unit': '[mV]', 'LongName': 'Peak Amplitude', 'Description': None, 'ShortName': None, 'FormatStr': None}, 'RT': {'SetTypes': 8, 'Unit': '[μs]', 'LongName': 'Rise Time', 'Description': None, 'ShortName': None, 'FormatStr': None}, 'Dur': {'SetTypes': 8, 'Unit': '[μs]', 'LongName': 'Duration (available)', 'Description': None, 'ShortName': None, 'FormatStr': None}, 'CTP': {'SetTypes': 8, 'Unit': None, 'LongName': 'Cnts to peak', 'Description': None, 'ShortName': None, 'FormatStr': '#'}, 'FI': {'SetTypes': 8, 'Unit': '[kHz]', 'LongName': 'Initiation Freq.', 'Description': None, 'ShortName': None, 'FormatStr': None}, 'FR': {'SetTypes': 8, 'Unit': '[kHz]', 'LongName': 'Reverberation Freq.', 'Description': None, 'ShortName': None, 'FormatStr': None}}
```

Show results as table:

```
print(pd.DataFrame(trfdb.fieldinfo()))
```

Out:

	FFT_CoG	...	FR
SetTypes	2	...	8
Unit	[kHz]	...	[kHz]
LongName	F(C.o.Gravity)	...	Reverberation Freq.
Description	Center of gravity of spectrum	...	None
ShortName	None	...	None
FormatStr	None	...	None

[6 rows x 8 columns]

### Write units to trfdb

Field infos can be written with `vallenae.io.TrfDatabase.write_fieldinfo`:

```
trfdb.write_fieldinfo("ATO_Hinkley", {"Unit": "[μs]", "LongName": "Arrival Time Offset (Hinkley)"})
trfdb.write_fieldinfo("ATO_AIC", {"Unit": "[μs]", "LongName": "Arrival Time Offset (AIC)"})
trfdb.write_fieldinfo("ATO_ER", {"Unit": "[μs]", "LongName": "Arrival Time Offset (ER)"})
trfdb.write_fieldinfo("ATO_MER", {"Unit": "[μs]", "LongName": "Arrival Time Offset (MER)"})

print(pd.DataFrame(trfdb.fieldinfo()).filter(regex="ATO"))
```

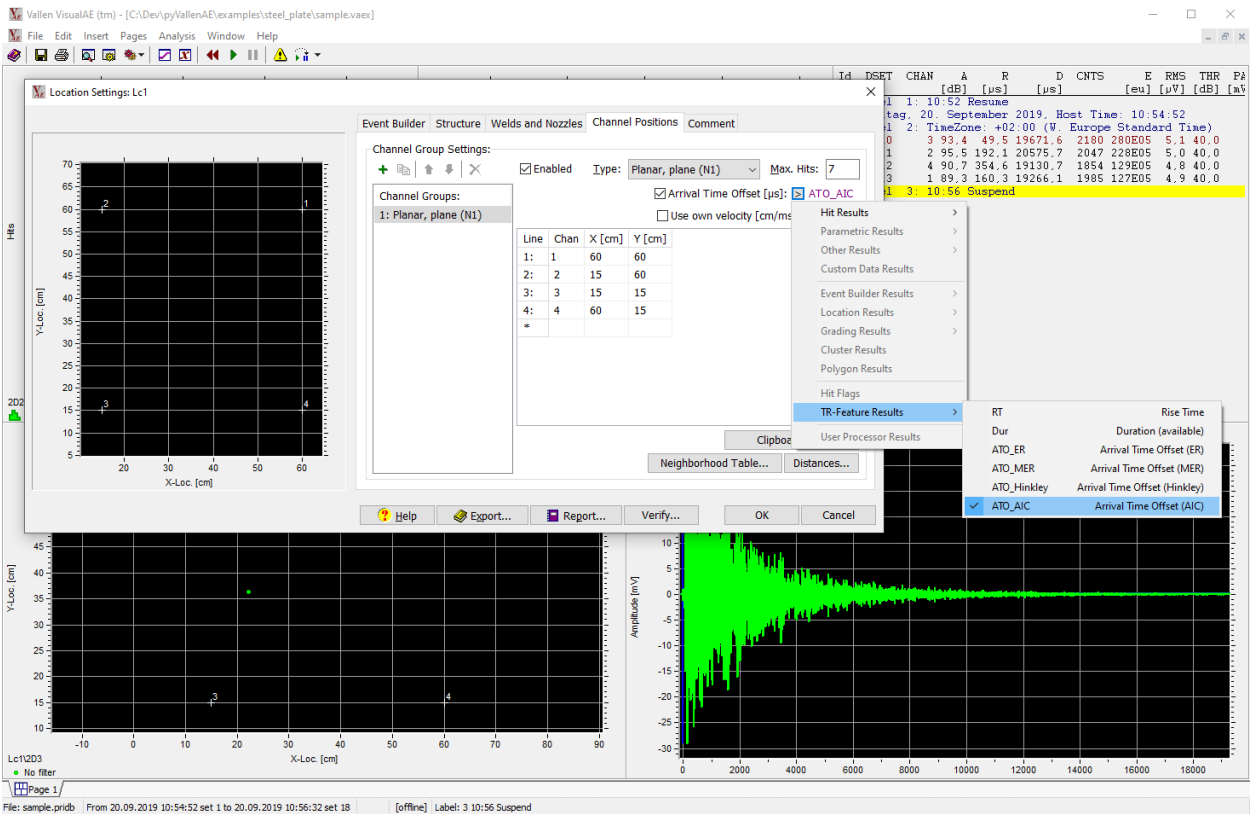

Out:

	ATO_Hinkley	...	ATO_MER
SetTypes	None	...	None
Unit	[μs]	...	[μs]
LongName	Arrival Time Offset (Hinkley)	...	Arrival Time Offset (MER)
Description	None	...	None
ShortName	None	...	None
FormatStr	None	...	None

[6 rows x 4 columns]

Load results in VisualAE

Time arrival offsets can be specified in the settings of *Location Processors - Channel Positions - Arrival Time Offset*. (Make sure to rename the generated trfdb to match the filename of the prfdb.)

Total running time of the script: ( 0 minutes 1.672 seconds)

## 4.5 Localisation

## 4.6 Go fast with multiprocessing

The streaming interfaces with iterables allow efficient batch processing as shown [here](#). But still only one core/thread will be utilized. We will change that will multiprocessing.

Following example shows a batch feature extraction procedure using multiple CPU cores.

```

import os
import time
import multiprocessing
from typing import Dict, Iterable
from itertools import cycle
import __main__

import numpy as np
from scipy import stats
import matplotlib.pyplot as plt

import vallenae as vae

HERE = os.path.dirname(__file__) if "__file__" in locals() else os.getcwd()
TRADB = os.path.join(HERE, "steel_plate/sample_plain.tradb")

```

### 4.6.1 Prepare streaming reads

```
tradb = vae.io.TraDatabase(TRADB)
```

Our sample tradb only contains four data sets. That is not enough data for demonstrating batch processing. Therefore, we will simulate more data by looping over the data sets with following generator/iterable:

```

def tra_generator(loops: int = 1000) -> Iterable[vae.io.TraRecord]:
    for loop, tra in enumerate(cycle(tradb.iread())):
        if loop > loops:
            break
        yield tra

```

### 4.6.2 Define feature extraction function

Following function will be applied to all data sets and returns computed features:

```
def feature_extraction(tra: vae.io.TraRecord) -> Dict[str, float]:
    # compute random statistical features
    return {
        "Std": np.std(tra.data),
        "Skew": stats.skew(tra.data),
    }

# Fix to use pickle serialization in sphinx gallery
setattr(__main__, feature_extraction.__name__, feature_extraction)
```

### 4.6.3 Compute with single thread/core

---

**Note:** The examples are executed on the CI / readthedocs server with limited resources. Therefore, the shown computation times and speedups are below the capability of modern machines.

---

Run computation in a single thread and get the time:

```
time_elapsed_ms = lambda t0: 1e3 * (time.perf_counter() - t0)

time_start = time.perf_counter()
for tra in tra_generator():
    results = feature_extraction(tra)
    # do something with the results
time_single_thread = time_elapsed_ms(time_start)

print(f"Time single thread: {time_single_thread:.2f} ms")
```

Out:

```
Time single thread: 1130.24 ms
```

### 4.6.4 Compute with multiple processes/cores

First get number of available cores in your machine:

```
print(f"Available CPU cores: {os.cpu_count()}")
```

Out:

```
Available CPU cores: 2
```

But how can we utilize those cores? The common answer for most programming languages is multithreading. Threads run in the same process and heap, so data can be shared between them (with care). Sadly, Python uses a global interpreter lock (GIL) that locks heap memory, because Python objects are not thread-safe. Therefore, threads are blocking each other and no speedups are gained by using multiple threads.

The solution for Python is multiprocessing to work around the GIL. Every process has its own heap and GIL. Multiprocessing will introduce overhead for interprocess communication and data serialization/deserialization. To reduce the overhead, data is sent in bigger chunks.

Run computation on 4 cores with chunks of 128 data sets and get the time / speedup:

```
with multiprocessing.Pool(4) as pool:
    time_start = time.perf_counter()
    for results in pool.imap(feature_extraction, tra_generator(), chunksize=128):
        pass # do something with the results
    time_multiprocessing = time_elapsed_ms(time_start)

print(f"Time multiprocessing: {time_multiprocessing:.2f} ms")
print(f"Speedup: {(time_single_thread / time_multiprocessing):.2f}")
```

Out:

```
Time multiprocessing: 1126.23 ms
Speedup: 1.00
```

### Variation of the chunksize

Following results show how the chunksize impacts the overall performance. The speedup is measured for different chunksizes and plotted against the chunksize:

```
chunksizes = (10, 40, 60, 80, 100, 120, 140, 160, 200)
speedup_chunksizes = []
with multiprocessing.Pool(4) as pool:
    for chunksize in chunksizes:
        time_start = time.perf_counter()
        for results in pool.imap(feature_extraction, tra_generator(),
        chunksize=chunksize):
            pass # do something with the results
        speedup_chunksizes.append(time_single_thread / time_elapsed_ms(time_start))

plt.figure(tight_layout=True, figsize=(6, 3))
plt.plot(chunksizes, speedup_chunksizes)
plt.xlabel("Chunksize")
plt.ylabel("Speedup")
plt.show()
```

**Total running time of the script:** ( 0 minutes 13.530 seconds)

## CHANGELOG

All notable changes to this project will be documented in this file.

The format is based on [Keep a Changelog](#), and this project adheres to [Semantic Versioning](#).

### 5.1 Unreleased

#### 5.2 0.6.0 - 2020-09-02

##### 5.2.1 Added

- CI for Python 3.9

##### 5.2.2 Changed

- Remove superfluous `data_format` field from `TraRecord` data type

#### 5.3 0.5.4 - 2020-05-25

##### 5.3.1 Fixed

- Limit number of buffered records in `listen` methods
- Time axis rounding errors, e.g. for `TraDatabase.read_wave` with `time_axis=True`

#### 5.4 0.5.3 - 2020-05-04

##### 5.4.1 Fixed

- SQLite URI for absolute linux paths

## 5.5 0.5.2 - 2020-05-04

### 5.5.1 Fixed

- SQLite URI for special characters (#, ?)

## 5.6 0.5.1 - 2020-03-25

### 5.6.1 Fixed

- Buffering of SQL results in `listen` methods to allow SQL queries in between

## 5.7 0.5.0 - 2020-03-18

### 5.7.1 Added

- Query filter parameter to `TrfDatabase.read` and `TrfDatabase.iread`
- `listen` method for `PriDatabase`, `TraDatabase` and `TrfDatabase` to retrieve new records live

### 5.7.2 Changed

- Order feature records by TRAI for `TrfDatabase.read` and `TrfDatabase.iread`

## 5.8 0.4.0 - 2021-02-14

### 5.8.1 Added

- CI with GitHub actions on Linux, MacOS and Windows
- Workflow with GitHub actions to publish to PyPI on new releases
- `pyproject.toml` as the main config file for `pylint`, `pytest`, `tox`, `coverage`, ...

### 5.8.2 Changed

- Return exact time range with `TraDatabase.read_continuous_wave`
- Return “absolute” time axis with `TraDatabase.read_continuous_wave` (instead of starting at  $t = 0$  s)

### 5.8.3 Fixed

- Fix database close if exception raised in `__init__` (e.g. file not found)
- Example `ex6_multiprocessing` for MacOS
- Find lower/upper bounds for same values (times) in binary search (used by `TraDatabase.iread`)
- Stop condition for `time_stop` in `TraDatabase.iread`
- Use TRAI for `TraDatabase.iread` as a time sorted index for binary search (SetID is not!)
- Check for empty time ranges in `TraDatabase.iread`

## 5.9 0.3.0 - 2020-11-05

### 5.9.1 Added

- Query filter for `pridb/tradb` (i)read functions

## 5.10 0.2.4 - 2020-11-01

### 5.10.1 Fixed

- SQL schemas for `pridb/tradb/trfdb` creation, add `fieldinfos`

## 5.11 0.2.3 - 2020-09-01

### 5.11.1 Fixed

- AIC timepicker
- Add threshold for monotonic time check (1 ns) to ignore rounding issues
- Suppress exception chaining

## 5.12 0.2.2 - 2020-07-10

### 5.12.1 Added

- Database classes are now pickable and can be used in multiprocessing
- SQLite transactions for all writes
- Faster blob encoding (`vallenae.io.encode_data_blob`)
- Faster RMS computation with Numba (`vallenae.features.rms`)

### 5.12.2 Fixed

- Catch possible `global_info` table parsing errors

## 5.13 0.2.1 - 2020-02-10

### 5.13.1 Fixed

- Examples outputs if not run as notebook
- Out-of-bound `time_start`, `time_stop` with SQL binary search
- Optional signal strength for e.g. `spotWave` data acquisition

## 5.14 0.2.0 - 2020-02-06

### 5.14.1 Added

- Database creation with `mode="rwc"`, e.g. `vallenae.io.PriDatabase.__init__`

### 5.14.2 Fixed

- Number field in `vallenae.io.MarkerRecord` optional
- Scaling of parametric inputs optional
- Keep column order of query if new columns are added to the database
- Return array with `float32` from `vallenae.io.TraDatabase.read_continuous_wave` (instead of `float64`)

## 5.15 0.1.0 - 2020-01-24

Initial public release
